

**WATER QUALITY IN THE HASOUNA  
WELLFIELDS, WESTERN JAMAHIRYA  
SYSTEM, GREAT MAN MADE RIVER  
PROJECT (GMRP)**

**by**

**NASER I.M. SAHLI**

**A Thesis Submitted for the Degree of  
DOCTOR OF PHILOSOPHY**

**National Centre for Groundwater Management  
University of Technology, Sydney  
New South Wales, Australia**

**Supervisor: Dr. W.A. Milne-Home  
Co-Supervisor: Assoc. Prof. A. Binsariti**

**March 2006**

**WATER QUALITY IN THE HASOUNA  
WELLFIELDS, WESTERN JAMAHIRYA  
SYSTEM, GREAT MAN MADE RIVER  
PROJECT (GMRP)**

**VOLUME ONE**

**THESIS**

## CERTIFICATE

March 2006

I, Naser Sahli, do declare that this project is my own work, and that to the best of my knowledge and belief, all the references and sources of information have been acknowledged.

Naser. IM. SAHLI

A handwritten signature in black ink, appearing to read 'Naser IM. SAHLI', written over a horizontal line. The signature is stylized with a long horizontal stroke and a vertical line at the end.

## **ACKNOWLEDGEMENTS**

I would like to dedicate this work to the soul of my Mother who died during the preparation of this work and also to my daughter Alla who has been suffering from a brain tumour for the past 5 years and I wish her a speedy recovery from this disease.

I would like to express my sincere thanks to the Great Man Made River Authority, especially Mr Abdul Majeed Al Gaoud, Secretary to the Peoples Committee (GMRA) for giving me this opportunity to complete my PhD.

My appreciation and gratitude also goes to my supervisors Dr. W.A. Milne Home and Assoc. Prof. A. Binsariti for their help and guidance during the preparation of this work.

I also acknowledge the staff at the National Centre for Groundwater Management for their encouragement and assistance during the completion of my PhD.

Also I would like to express my thanks to my father and my family for their patience and support during the time of this project.

Finally I would like to thank my fellow students F. Swaid and M. Alkhatib for their support during my time in Australia.

<b>CERTIFICATE.....</b>	ii
<b>ACKNOWLEDGEMENTS.....</b>	iii
<b>CONTENTS.....</b>	iv
<b>LIST OF FIGURES.....</b>	ix
<b>LIST OF TABLES.....</b>	xv
<b>ABSTRACT.....</b>	xx
<b>1.0 Introduction. ....</b>	<b>1</b>
1.1 Background.....	1
1.1.1 Great Man Made River Project.....	2
1.1.2 Major Groundwater Basins in Libya.....	4
1.1.3 Aims and Objectives.....	6
1.4 Previous Studies.....	7
1.1.5 Hydrogeology and Hydrogeochemistry.....	8
1.1.6 Regional Hydrogeochemistry and Isotope Analysis.....	10
1.1.7 Groundwater Recharge and Climate Change.....	10
1.2 Research Techniques and Methodology.....	11
1.2.1 Hydrogeology and Hydrochemistry.....	11
1.2.2 Isotopes.....	14
1.3 Structure of the Thesis.....	15
<b>2.0 Hasouna-Jeffara System.....</b>	<b>16</b>
2.1 Location .....	17
2.2 Regional Geology of the Western Jamahiriya System (WJS).....	19
2.2.1 Introduction.....	19
2.2.2 Stratigraphy.....	20
2.3 Geology of the Hasouna area.....	21
2.3.1 Hasouna Formation (Cambro-Ordovician).....	24
2.3.2 Zimam Formation (Upper Cretaceous - Palaeocene).....	25
2.3.2.1 The Lower Tar Member (Maastrichtian).....	25
2.3.2.2 The Upper Tar Member (Maastrichtian - Lower Palaeocene).....	26
2.3.2.3 The Had Member (Upper Palaeocene).....	26
2.3.3 Wadi and Eolian Deposits (Quaternary).....	26
2.4 Regional Hydrogeology in Western Jamahiriya System (WJS)...	27
2.4.1 Introduction.....	27
2.4.2 Aquifer System in WSJ.....	28
2.4.3 Aquifer characterized in WJS.....	30
2.4.3.1 The Upper Cretaceous (UC) Aquifer.....	30
2.4.3.2 The Jurassic-Lower Cretaceous (JLC) Aquifer.....	30
2.4.3.3 The Triassic-Jurassic-Lower Cretaceous (TRJLC) Aquifer.....	30
2.4.3.4 The Triassic (TR) Aquifer.....	30
2.4.3.5 The Cambro-Ordovician to Tertiary (CO-TE) Aquifer.....	31
2.4.3.6 The Cambro-Ordovician-Devonian (COD) Aquifer.....	31
2.5 Aquifer Branchings.....	33
2.6 Aquifer Recharge.....	34
2.7 Discharge.....	35
2.8 Groundwater Heads.....	35
2.9 Results of Exploration Activities in the Hasouna Wellfields.....	37
2.9.1 Exploratory 2.9.1 Well 29A/94 (REG 29-A).....	37
2.9.2 Exploratory Well 2DA (EXP2).....	37

2.9.3	Exploratory Well 4DA (EXP4).....	38
2.9.4	Exploratory Well 3DA (EXP3).....	38
2.9.5	Summary of the Exploratory Wells.....	38
2.10	Hydrogeology of the Hasouna Wellfields area.....	39
2.10.1	The Cambro-Ordovician (COD) Aquifer (Hasouna).....	39
2.10.2	The Zimam Aquifer.....	41
2.11	Type of Aquifers in the Hasouna Wellfields.....	42
2.11.1	Confined Aquifers.....	42
2.11.2	Unconfined Aquifers.....	43
2.12	Aquifer Parameter in Hasouna Wellfields.....	44
2.12.1	Calculated Transmissivity and Hydraulic Conductivity (K).....	44
2.12.2	Aquifer Pumping Test Analysis in the Jabal Al Hasouna Area....	47
2.12.3	Aquifer Test Analysis.....	52
2.12.4	Water level fluctuating phenomena.....	56
2.12.5	Hydraulic Properties.....	60
2.12.5.1	Transmissivity (T).....	60
2.12.5.2	Specific Yield (S).....	60
2.12.5.3	Hydraulic Conductivity (K).....	61
2.12.5.4	Drainage Factor (B).....	61
2.12.5.5	Boulton Delay Index.....	61
2.12.5.5	Conclusion.....	62
<b>3.0</b>	<b>Field Measurements.....</b>	<b>64</b>
3.1	Introduction.....	64
3.2	Water Temperature Measurement.....	64
3.3	pH value Measurement.....	68
3.4	Dissolved Oxygen (D.O.).....	70
3.5	Dissolved Carbon Dioxide (CO <sub>2</sub> ).....	72
3.6	Dissolved Hydrogen Sulphide (as S <sup>2-</sup> ).....	75
3.7	Ammonium.....	76
<b>4.0</b>	<b>Physical and General Parameters.....</b>	<b>77</b>
4.1	Total Dissolved Solids (TDS).....	77
4.2	Electrical conductivity (EC).....	82
4.3	Oxidation – Reduction Potential (ORP).....	84
4.4	Calculated Eh value.....	85
4.5	Total Hardness.....	87
4.6	Total Alkalinity.....	89
4.7	Analytical Ionic Balance.....	91
<b>4.8</b>	<b>Minor Chemical Constituents and Trace Elements.....</b>	<b>93</b>
4.9	Iron (Fe <sup>2+</sup> ).....	95
4.10	Orthophosphate (as P <sup>-</sup> ).....	97
4.11	Boron (as B <sup>3+</sup> ).....	99
4.12	Fluoride (F <sup>2-</sup> ).....	102
4.13	Copper (Cu <sup>+2</sup> ).....	104
4.14	Manganese (Mn <sup>2+</sup> ).....	105
4.15	Zinc (Zn <sup>2+</sup> ).....	107
4.16	Nickel (Ni).....	109
4.17	Lead (Pb <sup>2+</sup> ).....	111
4.18	Cadmium (Cd <sup>2+</sup> ).....	112
4.19	Chromium (Cr).....	112
4.20	Arsenic (As).....	113

4.21	Mercury (Hg).....	114
<b>5.0</b>	<b>Major Cations and Anions.....</b>	<b>115</b>
5.1	Introduction.....	115
5.2	Schoeller Diagram.....	118
5.3	Piper Diagram (Trilinear Diagram).....	119
5.4	Stiff Diagram.....	121
5.5	Calcium ( $\text{Ca}^{+2}$ ).....	123
5.6	Magnesium ( $\text{Mg}^{+2}$ ).....	125
5.7	Sodium ( $\text{Na}^{+}$ ).....	127
5.8	Potassium ( $\text{K}^{+}$ ).....	128
5.9	Bicarbonate ( $\text{HCO}_3^{-}$ ).....	130
5.10	Carbonate ( $\text{CO}_3^{-2}$ ).....	132
5.11	Chloride ( $\text{Cl}^{-}$ ).....	134
5.12	Sulphate ( $\text{SO}_4^{-2}$ ).....	136
5.13	Nitrate ( $\text{NO}_3^{-}$ ).....	138
5.14	Silica ( $\text{SiO}_2$ ).....	140
5.15	Analysis and Identification of Crystalline Phases within the Core Samples from Hasouna Wellfields.....	142
5.15.1	Introduction.....	142
5.15.2	Methodology.....	143
5.15.3	Result and Discussion.....	144
<b>6.0</b>	<b>Hydrochemical Processes and Data Analysis.....</b>	<b>145</b>
6.1	Introduction.....	145
6.2	Dissolution – precipitation.....	146
6.2.1	Saturation Index of Anhydrite.....	150
6.2.2	Saturation Index of Aragonite.....	151
6.2.3	Saturation Index of Calcite.....	153
6.2.4	Saturation Index of Dolomite.....	154
6.2.5	Saturation Index of Fluorite.....	156
6.2.6	Saturation Index of Gypsum.....	158
6.2.7	Saturation Index of Halite.....	160
6.2.8	Saturation Index of Magnesite.....	161
6.2.9	Saturation Index of Siderite.....	162
6.3	Ion Exchange and Mixing Processes.....	164
6.3.1	X-Y Plots.....	165
6.3.1.1	Chloride versus Sodium.....	165
6.3.1.2	Bicarbonate + Sulphate versus Calcium.....	166
6.3.1.3	Sodium versus Calcium.....	166
6.3.1.4	(Sodium – Chloride) versus (Calcium + Magnesium) – Bicarbonate - Sulphate.....	167
6.3.1.5	Calcium + Magnesium versus Bicarbonate.....	168
6.3.1.6	Sulphate versus Calcium.....	169
6.3.1.7	Sulphate versus Chloride.....	169
6.3.1.8	Chloride versus Bicarbonate.....	170
6.3.1.9	Sodium versus Calcium + Magnesium.....	170
6.3.1.10	Chloride versus Potassium.....	171
6.3.1.11	Total Dissolved Solids versus Magnesium to Calcium Ratio.....	171
6.3.1.12	Total Dissolved Solids versus Sodium to Chloride Ratio.....	172
6.3.1.13	Total Dissolved Solids versus Magnesium to Chloride Ratio.....	172
6.3.1.14	Total Dissolved Solids versus Sodium to Calcium Ratio.....	173

6.3.1.15	Total Dissolved Solids versus Calcium to Chloride Ratio.....	173
6.3.2	Stability Diagrams.....	174
6.3.3	Composition Diagrams.....	181
6.3.3.1	Cations versus TDI.....	181
6.3.3.2	Anions versus TDI.....	183
6.3.4	Expanded Durov Diagram.....	185
6.3.5	Anion and Cation Facies Classification Diagram.....	187
6.3.6	Pie diagrams.....	189
6.3.7	Eh – pH diagrams.....	194
6.4	Conclusion.....	197
<b>7.0</b>	<b>Chemical Indicators of Corrosion and Water Aggressivity (Saturation Indices and Corrosion Indices).....</b>	<b>199</b>
7.1	General.....	199
7.2	Langelier Saturation Index (LI).....	202
7.3	Ryznar Stability Index (RI).....	206
7.4	Calcium Carbonate Precipitation Potential (CCPP).....	209
7.5	Corrosivity Index (CI).....	212

## APPENDICES

### Chapter (2)

A	Hydrogeological Data for All Hasouna Wellfields Area.....	1
B	Calculated Hydraulic Conductivity, Transmissivity, Measured SWL and Measured DWL.....	21
C	Pumping test data.....	45

### Chapter (3)

D	Results of the Chemical Analyses Field Measurements.....	68
---	--	----

### Chapter (4)

E	Results of the Chemical Analyses Physical and General Parameters.....	84
F	Analytical ionic Balance.....	100
G	Average Values of Minor Chemical Constituents.....	116

### Chapter (5)

H	Comparison of the Analytical Results (Cations mg/l) from GMRA and Phosyn Laboratories, Hasouna water.....	141
I	Average Major Cations and Anions, All Hasouna	

	Wellfields.....	161
J	Data and Analysis Results for the Identification of Crystalline Phases within the Core Samples from Hasouna Wellfields. ....	186
	<b>Chapter (6)</b>	
K	Saturation indices of Minerals using MINTEQA2, All Hasouna Wellfields water.....	204
L	Calculated Values of log activities of Silica and Potassium, Calcium Magnesium and Sodium over Hydrogen, Hasouna Wellfields Water.....	229
	<b>Chapter (7)</b>	
M	Chemical Indicators of Corrosion and Water Aggressivity (Saturation Indices and Corrosion Indices) All Hasouna Wellfields water.....	245
	<b>Chapter (8)</b>	
N	The Alkali Hazard Calculated using the Residual Sodium Carbonate, RSC, All Hasouna Wellfields water.....	291
O	The Calculated Soluble Sodium Percentage (SSP) All Hasouna Wellfields water.....	289
P	The Calculated The Magnesium Hazard (MH%) All Hasouna Wellfields water.....	307

## ABSTRACT

The Hasouna Wellfields, comprising 484 wells designed to produce 2.5million m<sup>3</sup>/day of water, are part of the Libyan Great Man Made River Project (GMRP). They are located about 700 km south of Tripoli, in an area of stony desert and sand dunes, forming a rolling topography of low to moderate relief. The water will be conveyed by pipeline for water supply and irrigation to the coastal regions west of Tripoli.

Geologically, the study area forms the northern edge of the Murzuq Basin and comprises rock formations ranging in age from Pre-Cambrian to Upper Cretaceous. There are two aquifers: the Cambro-Ordovician (CO) Hasouna Formation (the main aquifer), and the overlying Zimam Formation. The Zimam Formation, which contains saline water, is absent over the part of the field area where the freshwater-bearing, Hasouna aquifer is unconfined. The CO aquifer is major regional aquifer with a transmissivity range between 1500 to 2000 m<sup>2</sup>/day and a storativity range from  $2.2 \times 10^{-5}$  to  $6.4 \times 10^{-2}$  between the confined and unconfined areas of the Wellfields. Pumping tests have shown that the CO aquifer is leaky-confined type over part of the study area.

Water quality is good with average total dissolved solids (TDS) of 1039 mg/l, average chloride content of 600 mg/l and a positive redox-potential, indicating an oxidizing environment. However, the concentration of dissolved CO<sub>2</sub> ranges from 3.7 to 97 mg/l and nitrate ranges from 0.0 mg/l to 133 mg/l. These two constituents can result in wellfield operational and consumer health problems respectively.

The main objective of this study was to make a complete investigation of the water quality, hydrochemical processes and all the physical and chemical properties of these Wellfields.

Special attention was focussed on the problem of corrosion due to the CO<sub>2</sub> and the nitrate. This research used various methods, including the classification of water type, analysis of field data, study of major and minor cations, anions and trace elements, and the determination of water aggressivity supported by field study of corrosion coupons, hydrochemical processes, water quality for potable uses and isotopic analysis.

The calculated saturation and corrosion indices indicated that the Hasouna water is corrosive. The field study using corrosion coupons demonstrated that the corrosive properties of the water can change under short term non-pumping conditions to be scaling in character. Although the GMRP has addressed the problem of CO<sub>2</sub> by stripping it in degassing towers before it enters the pipeline, the results of this research will assist the process by identifying areas of high and low CO<sub>2</sub> concentration. A similar approach of blending low and high nitrate water can be used for the nitrate problem.

The origin of high nitrate levels in the Hasouna water is problematic. Similar high levels occur in Sirt and Kufra basins in Libya, (Edmunds and Wright, (1979)). The isotopic analysis of  $\delta^{15}\text{N}$  (31 samples) and  $\delta^{18}\text{O}$  (6 samples) from nitrate for the Hasouna water suggested the source could be precipitation and soil nitrate ( $\delta^{15}\text{N}$  and  $\delta^{18}\text{O}$ ). The  $\delta^{15}\text{N}$  signature is similar to NH<sub>4</sub>, NO<sub>3</sub>, N<sub>2</sub> and effluent/manure. These sources imply a more humid climatic environment than the present. The stable isotope data indicate a meteoric origin for the groundwater, and the radiocarbon age is > 8 ka, which suggests that the Hasouna water is likely to have a late-Pleistocene or very early Holocene origin. At that time the climate was more humid than the present day arid conditions.

The water in Hasouna is classified to be class C3, for salinity hazard (High) and class S1/S2, for Sodium Hazard. This indicates that the blended water is suitable for irrigation with special management to control salinity.

The analysis of the speciation properties of the ionic composition of the water indicates undersaturation with all of the plausible mineral species. The hydrochemical processes, which control the composition of the Hasouna water are mixing, ion exchange and dissolution of gypsum and dolomite.
